RESILIENT SUPPLY CHAIN STRESS TEST

VIDEO TRANSCRIPT

The last few decades have seen supply chains become more global, complex, and balancing on a fine line between costs and agility.

The result? A shrinking margin for error, leaving many organizations more exposed to external disruption.

At the same time, the number of severe catastrophic events has increased. We've all seen how unexpected events can disrupt operations, even for industry leaders.

Based on recent Accenture research only 10% of companies are prepared for the unexpected. If you're one of the 90%, how do you get ready to meet the challenges and protect or even increase your market share

[Pause]

Developed by Accenture, the Supply Chain Stress Test is a pioneering data-driven concept, developed to quantify the ability of a company's end-to-end supply chain and operations to absorb, adapt to and recover from a disruptive event.

By conducting the Stress Test, you're able to test your supply chain against a number of disruptive scenarios—identifying points of failure, evaluating the efficiency of your mitigation plans, and assessing operational and financial impact of such events.

The overall results are summarized as a single Resilience Score, and the Stress Test dashboard lets you dive into details of each scenario.
