

What it's Like Working in Technology on Accenture's Graduate Programme

Video Transcript

00:02

My name is Jen Andreasson and I started in Accenture in October 2017.

00:09

I started part of the Technology Analyst Group. I studied Mechanical Engineering in Trinity

00:14

where I did my degree and my Master's. So, I work in Resources & Utilities.

00:20

So, basically at the moment I'm working to help implement the

00:25

new energy system into Ireland, which will help integrate us with the English and European market.

00:27

The biggest skill that I've brought across to Accenture is problem-solving.

00:34

So, basically the ability to take a very complex, very specific

00:39

project and problem - and basically just break it down into small parts and attack it one bit at a time.

00:44

That's something that I would have done in Engineering

00:46

and it's still something I do on client site every day.

00:53

So, when I was finishing up with engineering - I wasn't really sure if I wanted to keep on studying engineering

00:57

or if I wanted to go into something else.

00:59

Accenture has a very diverse range of clients and projects - that appealed to me

01:04

because I didn't want to be stuck in one area. It meant that I could, you know,

01:08

learn about products. I could learn about utilities. I could learn about life sciences.

01:12

And all under the one company

01:16

My favourite part of the job... I think is the fact that every day is different.
