

YOUVIEW CASE STUDY

VIDEO TRANSCRIPT

Mark

With the Capacity management we want to make sure that we have enough infrastructure for the amount of devices that are connecting to the YouView system. To be able to work out how much infrastructure we need we have a custom-built tool which simulates production behaviour and we'll be able to build a picture of what the connected active device count would be for the next, at least 12 months.

So we're looking to increase the active device count by about 5% each month. YouView's goal right now is to get into 10 million homes. So in YouView, something quite exciting that's happened recently is that we've had a partnership with Sony, so what Sony wanted to do, they've created a connected TV, so this is a TV which you can connect with Wi-Fi or plug your Ethernet cable into it. Once you do that you'd be able to see the YouView EPG, so I think what this is, this is a brief concept that other device manufactures can use, so right now we're doing a new data-migration, we're going to start using Redshift and some other AWS services and this is a project that we just started maybe a month ago and we'll be finished in 3 months and it'll believe.

So with Accenture we help them, be more Agile I guess, you know we can quickly turn-around a situation, if they want something we can quickly implement it.
