

SOFTWARE AGILITY AT ACCENTURE

VIDEO TRANSCRIPT

Accenture really focuses on pushing Agile's methodology, understanding what it can do in terms of delivering in IT. Whether it be software, infrastructure, any sort of IT project. Our philosophy with Agile is that we're always trying to improve. It is been fast-paced learning, but Accenture really promotes your own growth. They really wanna you know, push you and want you to succeed at this company. Coming out of college, I knew about Java and C, and a little bit of Python, and that was really it. And then when I joined AFS that's kinda really when I learned a lot more. One of which was hardening those languages that I already knew, then the second part of it was getting exposed to a bunch of different languages. I joined Accenture three and a half years ago, it's been a fun few years. I worked on two projects so far and used technologies like Java, Spring Framework, C#, Dot Net Framework. What I really love is that we get to work hand-in-hand with our clients to develop solutions that provide a lot of valuable improvements to their business, and valuable features for their users that help make their lives easier. At Accenture, we're in a position of trust with the customers that we interact with, and so they often come to us with problems where they don't have any idea on how to solve those problems. And so, to be in that position where we can work with the customer as a partner, that is exciting, but it also is humbling to be able to work side-by-side as a partner with the customer, using technology to solve what today, may seem like an intractable problem.
