On any journey, isn’t it best to feel safe from the start?
These days, businesses that want to be fast and flexible are turning to the public cloud.
And yet security could brew up a storm in any cloud-first journey.
“We need a single sheet of glass for visibility into our vulnerabilities, but right now many enterprises with multi-cloud instances are looking through a mosaic.” Kris Burkhardt, Accenture CISO.
There are weaknesses in governance and compliance.
Getting security right is a complicated business.
Plus the right people and skills are often in short supply.
Yet security could give you the edge.
Baked in from the start…
…security speeds the race to cloud.
Here are four ways to benefit from cloud’s silver lining:
01 Know your cloud security posture.
Find the gaps in your overall security status—and the best way to reach your goals.
02 Automate native security.
Make it easier to take advantage of established cloud providers’ services.
03 Be proactive with compliance.
Get better at detecting vulnerabilities and avoiding risks.
04 Employ security monitoring and response.
Use tools and insights to keep up-to-date with evolving threats.
Make your cloud-first journey secure by design.
