IMAGINING A CONNECTED WORLD

VIDEO TRANSCRIPT

Imagine a world where all public services are provided seamlessly through collaboration among public and private sector partners, NGOs, citizens themselves, and even robots.

A world where those partners work together co-designing and co-producing services for the betterment of society as a whole.

We can make this world a reality – if we move away from historical government silos and start considering government as a platform.

The foundation of government as a platform is a network of government, private companies, NGOs, and connected civil servants and citizens, all collaborating and innovating together to create better outcomes.

It's supported by technologies involving data, connectedness, and machine learning coming together to enable more efficient, impactful and secure public services.

Technologies like:

Interactive
Mobile
Analytics
Cloud
Security
Artificial intelligence
Blockchain
Virtual reality

In many places, government as a platform is already leading to greater outcomes:

Innovation
Mission impact
Economic development
A more engaged workforce
And delighted citizens

Together, let's imagine a world of partnerships, digital enablement, co-design and creation to support better public service outcomes for society as a whole.

That reality is emerging now.
