By providing them with a more centralized tool, researchers can better anticipate and project future demands while making their insights more visible to others.

Ultimately, that helps everyone do a better job of planning to meet the needs of its people.

As the world’s population expands towards 8 billion and more, we face some huge global issues, such as food security and the future of agriculture, that we must find new ways to solve.

Until now, it’s been impossible to obtain an integrated view of these massive global issues.

But having that view is essential for planning around human needs and long term sustainability.

That’s where Project 8 comes in.

Project 8 is an online, global community for organizations and researchers to work together towards global solutions.

Sharing data is fundamental to enabling organizations to better understand the truly tough global challenges facing us all.

Why is that so important? Because it makes it possible to coordinate and focus initiatives where they are needed most and supports the development of policies that will help to safeguard our futures.
