CLINICAL DATA INTEGRATION SURVEY

Healthcare organizations rely on health information and integration across multiple sources to make the best decisions when caring for patients, reduce costs for hospitals, and increase provider efficiency. Integration ensures vital real-time clinical data is available in patient records at the time of service.

However, data integration is often hampered by complex workflows, dispersed IT systems, and heterogeneous data sets and standards. Accenture surveyed 105 IT executives from payer and provider organizations in Europe and the United States to better understand motivations, obstacles and trends in clinical data integration.

About the Survey:
This survey gives only directional guidance. We surveyed 105 health IT executives in Europe & the US in December 2018, including CIOs, CCIOs, CDOs (data/digital), Informatic and Data governance Leads, across provider and payer organizations, which provided insights into the complexities these organizations face with clinical data integration. Countries included: U.K., France, Germany, Italy, Spain, Sweden, Norway, Denmark, Finland, Iceland and the United States.
