

INTELLIGENT OPERATIONS SUPPLY CHAIN

VIDEO TRANSCRIPT

Supply chain leaders are under pressure to outmaneuver uncertainty while maximizing cost efficiency and enabling sustainable growth by providing richer customer experiences.

But when supply chain processes are fragmented, lacking visibility and slow to react – how do you maintain pace?

Move to an intelligent supply chain – one that is transparent, predictive and resilient. With an intelligent supply chain, you can create data-driven operations that respond in real-time to ever changing customer and business demands, increasing visibility so you can create more value, in new ways, than ever before.

A global semi-conductor supplier automated 75% of their supply chain processes, freeing their talent to focus on creating innovative products and better serving customers.

An intelligent approach to spare part planning allowed one Global Healthcare Technology company to eradicate over \$130m in operating costs.

And a North American retailer grew revenue by over \$17m by improving accuracy in forecasting and inventory.

To accelerate their journey to an intelligent digital operating model these companies tapped into SynOps, our platform that orchestrates the optimal combination of human + machine talent to drive outcomes in every link.

From product design, to manufacturing, to aftersales, an intelligent supply chain operating model gives you the power to make sure you have the right products and services in the right place, at the right time.

Meeting demand and growing your business.
