

WHAT IS IT INFRASTRUCTURE?

VIDEO TRANSCRIPT

What is IT infrastructure? IT infrastructure is the backbone of today's digital business.

IT infrastructure provides the compute, network, workplace and data platform capabilities needed to empower the users and run the applications that run the business.

Traditional infrastructure includes expensive hardware, data centers and servers all requiring manual intervention.

To take advantage of the opportunities of the Cloud Continuum, companies must modernize to a software-defined and intelligent infrastructure.

Modern infrastructure includes a mix of...

- On-premise data centers,
- Hybrid multi-cloud environments,
- And Edge computing devices
- All connected by Enterprise and 5G networks.

Increasingly infrastructure is code that can be automatically managed and monitored, resources automatically provisioned. No more manual configurations required!

It's a hybrid multi-cloud world, and enterprises need a modern hybrid infrastructure to match.

That's IT infrastructure!
