

AI FRONTIER MODELS – PALO ALTO NETWORKS

VIDEO TRANSCRIPT

Alistair Wildman: Hi, everybody, My name is Alistair Wildman. I run the Palo Alto Networks team here in the UK.
The big talking point right now for our customers and things that are really top of mind is Mythos and the AI frontier models that have come out from both Anthropic and OpenAI.

A lot of customers are really worried about what this is going to mean to their security landscape and their posture and they come to talk to Palo Alto Networks to get advice and guidance from our Unit 42 team who are an incredible set of technologists.

What we say to our customers is, number one, you really need to have a look at your code and check your code. We can help you do it, or you can do it for yourself or go with one of our amazing partners, because this is something that has to be done.

But if they do get in through whatever means and they get to the SIEM you need an AI driven SOC. Okay. If you don't have a latest AI driven SOC that's really using the latest machine learning and AI to defend yourself, you're going to be in trouble. Because the quickest attack that we've seen in this new Mythos era is about 24 minutes. Yep, that's 24 minutes for the bad actors to get in and take out large amounts of data.

So that means that your mean time to detect and respond has to be sub 24 minutes. The customers that we're working with - and we've got about 7-800 customers now, they've got our AI driven SOC -

They're looking at less than 15 minutes. The good news is we've teamed up with Accenture, our fantastic partners, because we're going to help keep you safe. Geo, what do you think?

Giovanni Cozzolino: Thanks Alastair. My name is Giovanni Cozzolino, and I'm Accenture's EMEA Security Lead.

Alastair is absolutely right. The rule book around security, detection and response is absolutely shattered. Given that the fact that clients are now seeing attacks and data being exfiltrated within 24 minutes. This is why the relationship between Palo Alto Networks and Accenture is fundamentally important and so critical to securing our clients environments.

Palo Alto Networks AI leading organization for cloud security, network security, detection and response services, and really driving AI through their product set, along with Accenture's services, where we design, build and run these services really maximizes the investment that clients make into this technology set and also gets that leading expertise in securing their environment.

So if you have questions or queries or complications around how AI frontier models affect your business, please reach out to the details below for a consultation with either Palo Alto Networks or Accenture.
