Docc Control

IoT facility management

Docc Control is a smart platform for maintaining and operating buildings. They asked VanBerlo, part of Accenture, to help create an IoT based facility management tool.

The tool is based on a ticketing system which can be triggered by employees and also by nodes placed around the building, that interact with the platform, highlighting issues that need to be fixed.

We provided an end-to-end service including strategy/roadmap, user-centric design of the platform interface and design of the physical nodes.

By connecting different networks and combining information, the platform streamlines the management process, making it easier for the client to monitor and control various aspects of the building. The installer training, also helped the client have a smoother transition process, reducing the complexities and challenges associated with adopting smart technologies.

The platform and automated ticketing system allows for optimized facility management and helps increase efficiency and desirability of the building.
