FEDERAL TECHNOLOGY VISION 2022: WEBME

VIDEO TRANSCRIPT

In *Trend 1: WebMe*, we explore how a new digital world that users can experience, explore and inhabit virtually is taking shape.

What's driving this transformation is the convergence of the metaverse with Web3. The metaverse provides a more immersive, dynamic, life-like experience for users. Web3 provides audiences with a greater sense of place, context and ownership. Together, they can foster a digital world that is increasingly mirroring our physical reality.

As we highlight in the Accenture Federal Technology Vision, federal agencies are exploring how they can capitalize on this new world. For example, the Army is refining its Synthetic Training Environment to revolutionize its entire training paradigm by allowing units and soldiers to conduct realistic, multi-echelon collective training anywhere in the world. Other important use cases include streamlining operations and logistics, fostering more collaborative work, and serving citizens more effectively.

However, this new world also makes greater demands for interoperability. Long-term success will require integrating with an ever-present data layer used to ensure veracity, trust and consensus.

The future of the Internet is taking shape, and we invite you to explore it in *Trend 1: WebMe.*
