Ger Daly
Managing Director,
Accenture Security
Health and Public Service

Ger Daly
The human factor is a very, very important one in the area of cybersecurity. Very often we see social engineering scams that are aimed at extracting information from employees and then using that information to gain access to the organization. So one of the responses to that that we see is the increased demand for cybersecurity training, to embed that into the culture and the skills development of organizations so that the employees can go from being in some ways points of vulnerability to in fact points of protection where they’re educated in cybersecurity threats, they can help identify where those occur, and they can help ultimately to protect the agency better.
