Clients are seeing that they need to have something that can span all of their physical and virtual footprints and deliver a solution that can leverage technology to protect them right now.

We’ve changed the game and enabled our clients to be able to position themselves effectively against the bad guys.

We’ve designed a best-of-breed, state-of-the-art, artificial-intelligence-based security defense platform, the Accenture Cyber Intelligence Platform.

What’s special about it is that it takes the best of artificial intelligence, machine learning and couples that with operational analytics to deliver near-real-time awareness across our customer’s infrastructure, across the type of access they may have, mobile, IOT, traditional cloud, or data centers and positions them to protect all of it in one fell swoop.

Without it, you can’t respond in real time, you really don’t know what your positioning is relative to hackers who are attempting to break into your network.

You can easily click on a link and it will graphically depict for you what that attack looks like, where the attack is coming from. And it enables you to be able to tell the story of what’s happening to your organization in real time so that you can take action.

In benchmark testing it’s proven to operate about ten times faster than anything else available in the marketplace today.

We can take down the average detection of incidents from the current average of about two hundred days, down to just handfuls of days.
We’ve wrapped Accenture’s Cyber Intelligence Platform with security specialists. We deliver it as a managed service end-to-end and it’s cloud-based, which means that we can actually have this solution up and running for our clients within about seven days from the time they give us the go sign.

Accenture’s Cyber Intelligence Platform is powered by strategic relationships that we have with Intel as well as Cloudera and each of these partners brings functionality that is patented, powerful and delivers new capabilities.

Effective cybersecurity today requires a 360-degree approach. What that really means is that you can’t just be a red team, you can’t be a blue team. You need to be a purple team. The purple team is able to defend and also attack. And with those combinations of capabilities you have an effective plan to help defend your business, focus on what’s right, which is growing the business, rather than draining your resources just trying to keep the doors open.
