Managers and machines, unite!
Three things managers must do to make the most of cognitive computing
Intelligent machines are changing the game by freeing managers from routine tasks and letting them focus more on strategic issues. But a few key things are holding progress back.

To start, managers aren’t yet sure how to work in partnership with machines — and they’re less likely than executives to trust recommendations made by machines. Plus, the path to realizing the value of working alongside machines is still unclear.

So what can the C-suite do to make sure their management teams are ready?

First, sharpen the human edge and train managers to get the interpersonal skills they’ll need to build collaborative teams and foster innovation.

Second, executive need to rally the troops and put their own skills to work building managers’ trust.

And third, chart a course of discovery. “Fail fast” experimentation will help the whole team zero-in on high value opportunities.
