Managing Healthcare Using the Internet of Health Things

It is the convergence of these value-added waves that is accelerating business imperatives for healthcare organizations.

The Internet of Health Things (IoHT) is already delivering tangible cost savings. But these concepts are now deliverable at scale. The IoHT era is different from the internet era in several important ways:

- The digitization of everything
- Regulatory changes (for example, from fee for volume to fee for value)
- Demographic shifts (aging population and the explosion of chronic disease)

IoHT has evolved through the three digital waves to open up the possibilities of growth for tomorrow.

SO WHAT IS NEW?

The answer is that all of these concepts are now deliverable at scale. It is not only possible to create IoHT services, but it is becoming a business imperative for healthcare organizations.

More are being actively discussed as early as the late 1990s.

The arrival of smart objects that are able to understand and when we need what we need has opened up the possibilities of growth for tomorrow.
